The following post was submitted by Becktemba

Blacklight Power having challenges sourcing parts and controlling its prototype. Alludes to problems with the brain of the system or controlling the system. Also with sourcing certain components.

Check out Blacklight Power's latest tweets.

Sourcing issues delay prototype. A bit more complicated than:

Prototype scheduled probably early 2015. Sourcing components issue. Can't get at Home Depot or Lowes.

I was lucky enough to attend the july demo at the BLP labs. What struck me was the convincing tones of the defense contractor representative. He said that the military, specifically the air force, has been watching BLP closely, and will be the first in line when they have a product. I asked him if he thought that, from a national security point of view, the military will absorb all the production, leaving no units for civilian use. He dodged my question, responding with a description of how energy production is the military's highest hourly operating cost.

Seeing the live demo, what struck me as a major design hurdle, was the ability to keep the lense clean that separates the plasma production chamber from the solar collection unit. There is quite a bit of "spatter" from the reaction, and it will quickly cover and block the lense, stopping the light from reaching the pV's. Keeping this lense clear will be a paramount concern. I did read somewhere that they have come up with a slurry that has a lower water content, but with the amount of energy that plasma releases, there is no way to stop the outward ejection of the slurry material. I have thought of an adaptation of an existing invention to keep the lense clear, and if I had the opportunity, would be glad to share with BLP. Being in the room and seeing the plasma created was a great experience, it really creates a unique sound.

Thanks for that report. Assuming you have seen the video, would you say that the video properly conveys the light and sound of the metal-water hydrate explosions you witnessed, or does it fall short?

Last week I commented on Always Open re Dr. Kroesen's replication of Mills hydrino experiments:

<https://drive.google.com/file/...>

And yet very few people, scientists, university labs have ever bothered to repeat these experiments and replications. This is hard evidence that Dr. Mills' hydrino theory is accurate in its predicative ability. The work has occurred at the Technical University of Eindhoven -

"

In 2003 a European Commission report ranked TU/e at third place among all European research universities (after Cambridge and Oxford and at equal rank with TU Munich), thus making it the highest ranked Technical University in Europe."

I remain convinced that Dr. Mills, following Pons & Fleischmann is the father of "cold fusion" and that the theory of atomic hydrogen compressed to a resonant low energy state is a central factor. But it is curious how BLP has remained intact with *commercial* products. Maybe he sells designs for non-commercial products to people who want to keep this tech classified? Nah...

"Excellent" paper, thanks. I think it was translated from Dutch or German. Very clear and understandable by the layperson. Yet the original was published I think at least 7 years ago. Things like this should have set the world of plasma physics, and quantum physics abuzz. Instead, almost dead silence.

I think Dr. Mills is successful at raising investment year after year in part because he knows his work and can speak of it off the top of his head in a very convincing fashion.

CORRECTION: BLP has remained intact **without** commercial products.

There may be a conspiracy to delay and/or suppress at work. The Solar Hydrogen Trends dudes recently said something to the effect of it being, in their opinion, irresponsible to flood the market with their new technology too fast. Do they really believe that, or is a government conspiracy stopping them? Could the same thing, or a similar thing, be at work with Blacklight?

  • Reply • Share**US\_Citizen71** > Mark • 5 months ago

With SHT it is more likely fraud prevents them from flooding the market at all than any type of conspiracy.
